OPIS

It receives commands and metadata from the master control room playback vsnmatic to start and stop recording and to import metadata from vsnmatic's rundown for text browsing.

VSN has recently launched the new version vsnlegalrec DTT, which is now compatible with digital broadcasting. The new vsnlegalrec DTT allows to record in Windows Media format the signal received in digital television stations while maintaining all the features of the previous version. To facilitate signal distribution to a greatest number of viewers, the system offers the two streaming modes, that is, with or without Windows Media Server. Its channel searcher allows to easily spot the channel you want to record without you needing to introduce the required parameters manually. Along with its sister application, vsnlegalplayer, the required

materials are retrieved and exported to a separate file. The capture date and time can be embedded into the video for visual registry purposes.
