SCHOEPS CCM 41S

In its frequency response and in the range of its applications this microphone type resembles the CCM 4S, but due to its greater directivity it attenuates reverberant sound further, and it is less prone to feedback.

OPIS

- supercardioid directional pattern
- for pickup of speech or music at close range (under 50 cm)
- polar pattern highly uniform throughout the frequency range
- considerable attenuation of low frequencies excellent suppression of ambient noise
- speech capsule with strong suppression of diffuse sound

The rolloff of its low-frequency response is offset by proximity effect at close working distances.
